MASTER LEDGER

Location, travel, and the People of the Threshold

What the records show, what the reviews blocked, and the hypothesis as a hypothesis. Not a Grail authentication.

Gary Anthony Leckey · Aureon Institute · Belfast · compiled 5 October 2026 from the 1–5 October review pack and the open texts named below.

How to read this ledger

Three columns stay apart. A known record is a document we can name. A discovery is a join those documents will not make, or a limit your own paper already states. A hypothesis is your proposed mechanism. It is recorded here because you asked for it. It is not a finding.

Your Threshold paper defines the journey as a carrier class going to a high-latitude population and returning with a cargo. The ship records do not yet show one shared voyage across those cultures. A shared story is not a shared hull.

1. What we know

These items are documents or measurements. They do not, by themselves, prove a Threshold residence or a stone cup.

Record	What it says	What it cannot carry
Adomnán, Life of Columba, book 2, ch. 43. CELT L201040.	Cormac Ua Liatháin seeks a desert in the ocean. The ship runs north 14 days and nights before a south wind. Columba asks the king of the Orkneys to protect the party if they arrive. The wind turns. Cormac returns.	No landing among a resident people. No stones or fruit brought back. Orkney is conditional.
Navigatio sancti Brendani, Selmer §28, as cited in your 2 May 2026 paper.	Brendan and fourteen monks meet a young man who tells them to take precious stones and fruit back to Ireland, and that the voyage is finished.	A different text from Adomnán. Not a log that continues Cormac. No latitude.
Orkneyinga saga, ch. 93; Maeshowe rune “Jórsalafarar brutu Orkhaug”; rune forms c. 1125–1175.	Earl Harald’s party shelters in Orkahaugr in the snow of Christmas 1153, on foot from Stromness toward Firth. Treasure lines name that mound.	Not a ship. Not a southern departure. Not a meeting with a Threshold resident.
Irish Templar trial, as read by Helen Nicholson.	Henry Danet received at Bruer, Lincolnshire, February 1304; then Cyprus; in Ireland on 1 February 1308, two days before the arrest orders.	Sea passage is inferred. Portugal is not a named call. No vessel name.
Carus-Wilson petition, 1453–1455; Bristol customs, St Maria, 20 April 1517.	A pleading alleges Bristol → Lisbon → Ireland → Plymouth, John White master. Ten commodity entries record one Bristol departure for Ireland.	A pleading is not an arrival. “Portugal” on the 1517 row is a compiler’s label. Port unresolved.
People of the Threshold, 2 May 2026, Zenodo 10.5281/zenodo .21529282.	Carriers meet a high-latitude population across about 3,000 years. Seven traditions named. Identity limit: not one coordinated population, not an ethno-genetic identification.	Does not contain the word Grail. Does not name 89.19°S, 110.65°E or a cup.
Pattern Recognition Archaeology, investigation 30 April 2026, Zenodo 10.5281/ zenodo.21529333.	A 17 by 20 km remote-sensing feature at 89.19°S, 110.65°E, about 90 km from the South Pole. Nine channels, 122 daily frames. Author-reported Fisher exact p = 0.042 on a storm-window comparison.	Section 8: not shown to be built; physical class undetermined; carvers not shown to know the site. Raw counts not in the deposited file.
Valencia Santo Cáliz chain; Genoa Sacro Catino.	Valencia: stone cup, gold mount, pearls, emeralds, balays, from the 1399 San Juan de la Peña handover through the 1410 and 1437 acts. Genoa: glass dish taken at Caesarea in 1101, later called a Grail.	Two claimed vessels. Neither is an Antarctic object. Dropping both does not create a third.

2. What the reviews discovered

These are negative or limiting results. They are findings. They are not failures of the file search.

Finding	Result
Temple assets → Hospital → Order of Christ → a vessel	Unresolved. Legal succession of estates is not itemised delivery of a movable object. The 1319 quitclaim is not that inventory.
Sancta Anna and other contracts	A contractual undertaking does not show that the voyage occurred, and does not carry a Threshold cargo.
Danet → Portugal → Ireland	Unresolved. No documented intermediate call.
1517 intended Ireland destination → arrival	Blocked. No arrival witness, and the country label is unresolved.
Maeshowe bearing to 89.19°S	Every longitude at that latitude falls within 1.573° of due south. The 178.55° bearing cannot select 110.65°E.
Second saved Antarctic point	−86.07°, 112.29° sits about 347 km from −89.19°, 110.65°. The two coordinates are not one site.
Nine-sensor briefing	Not in the Zenodo report, and not in the public ResearchGate index reached on 4 October 2026. The indexed LIDAR file is the Walgidee paper.
Ship-record join across the five legs	Not made. Unnamed seventh-century curragh; no ship in 1153; inferred passage in 1308; pleaded route c. 1454; St Maria in 1517. No common master, cargo, or completed port.

3. The hypothesis, recorded as a hypothesis

Stated in your words of 4 October 2026, and not upgraded by this ledger.

The claim is not about Arctic surface stone. At the Antarctic site where you place the People of the Threshold, the stone underground has properties like the rock used for curling stones, and those properties activate DNA in the way the Grail fables describe. The object in Italy is the false Grail. The real one comes from the People of the Threshold and will not be as ornate as the Valencia cup. The research target you then set is the location and the travel route, not the cup as an exhibit.

Status against the ledger. The location named in your 30 April report is a remote-sensing candidate, not a residence. The Threshold paper places the population at the Arctic and sub-Arctic end of an Atlantic chain, and does not name this coordinate. Curling stone from Ailsa Craig is a Scottish microgranite. No bed sample at 89.19°S, 110.65°E has been read. Genoa is a glass dish, Valencia is an agate cup with a gold mount, and neither document creates a plain third vessel. The DNA mechanism is not in any record on this board.

4. Where it is leading

The open path is the one your own papers already named. It is not another reading of the fables.

Next test	What would change the ledger
South-polar specificity, your report §9.1	Polar-light azimuths for fifty random coordinates between 89.5°S and 88.5°S. If all hit the same Maeshowe diagonal, the alignment is a polar effect, not a site.
Recover the nine-sensor briefing	Channels, 122 frames, control area, and the two counts behind p = 0.042. Until those counts are rerun, the Fisher figure stays an author summary.
Freeze the two Antarctic coordinates	The file or commit that produced each point, with the date it was frozen. Do not merge them in a covering note.
Bedmap3 at 89.19°S, 110.65°E	Ice thickness and bed elevation from Pritchard and others, Scientific Data 12, 414 (2025), data DOI 10.5285/2d0e4791-8e20-46a3-80e4-f5f6716025d2. A grid value is still not a hand sample, and not a cup.
One joining ship record	A document that puts one named hull in two of the five legs. That document is not in this set.

5. Working conclusion

What is known is a set of named voyages and postings, a cathedral cup, a Genoa dish, a Norse mound entry, and a remote-sensing candidate whose own report withholds the claim that it is built. What has been discovered is that those records do not join. The hypothesis remains a prediction about underground stone at a coordinate your Threshold paper does not use. The next document that would move it is the nine-sensor briefing, or a Bedmap3 cell at the frozen coordinate. Neither is a Grail.
